"Structure of the gene for the neuronal intermediate filament pr
alpha-internexin and functional analysis of its promoter.";

J. BIOL. CHEM. 266:19459-19468(1991).

-i- FUNCTION: CLASS-UBURONAL INTERMEDIATE FILAMENT.

-i- DEVELOPMENTAL STAGE: LEVELS OF THIS PROTEIN REACH A MAXIMUM
EMBRYONIC DAY 16 AND DECLINE INTO ADULTHOOD.

-i- SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The DNA sequence from Streptococcus sobrinus strain 6715 encodes glucosyltransferase-I (and mutants). The DNA was obtd. by treating 5. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli JM109 transformed with it. A GT-I expressing clone was isolated and sequenced. The clone may be used in the development of a drug for

A method has been developed for identifying a herbicidal agent which
A method has been developed for identifying a incubating a Di protease
inhibits Di protease. The method comprises: (a) incubating a Di protease
enzyme in a sample suspected of containing a herbicidal agent with a
enzyme in a sample suspected of containing a herbicidal agent with a
suitable Di enzyme substrate, where an enzyme product is formed; and (b)
suitable Di enzyme substrate, where an enzyme product of step (a). Also described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        JIT 3

Alpha-D-glucosyltransferase, primer-independent; soluble glucan;

sucrose; transgenic plant; cloning; Escherichia coli;

phage lambda-Cl3; vector; plasmid pGSG501; plasmid pGSG502;

gene transfer; crop improvement; storage carbohydrate; pasture;

feedstuff; senescence; dextran; binder; food; pharmaceutical.

Streptococcus salivarius strain ATCC 25975.

WOSGO173-Al.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Classification of lymphoma or lung cancer - on the basis of a point mutation in c-raf-1 gene
Example 3; Column 11-14; 26pp; English.
W17045, the mouse c-raf-1 protein, was used in a method for classifying a lymphoma or lung cancer. The normal sequence given here was compared with the sequence of c-raf 1 proteins derived from different tumours indice. The method, when used for diagnosing human tumours, involves detecting the presence of a point mutation in a conserved region of the c-raf-1 gene (codon 53), encoding Ser, in this sequence) derived from lymphoma or lung cancer tissue and classifying the lymphoma or lung cancer as a c-raf-1 mutation-associated cancer if one or more point mutations are present. The method is particularly applicable to lung
Classification of lymphoma or lung cancer - on the basis of a point mutation in c-raf-1 gene claim 2; Column 35-38; 26pp; English.
W17044, the human c-raf-1 protein, was used in a method for classifying a lymphoma or lung cancer in an individual. The method involves detectif the presence of a point mutation in a conserved region of the c-raf-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (USSH) US DEPT HEA

Example 3; Column 13-18; 26pp; English.

MJ7046-WJ7049 are mutant versions of the mouse c-raf-1 protein, derived from four different types of tumour. They were used in a method for classifying a lymphoma or lung cancer, by comparison with the wild-type c-raf 1 protein sequence derived from different tumours in mice. The method, when used for diagnosing human tumours, involves detecting the presence of a point mutation in a conserved region of the c-raf-1 gene (codon 533, encoding Ser) derived from lymphoma or lung cancer tissue and classifying the lymphoma or lung cancer as a c-raf-1 mutation-associated cancer if one or more point mutations are present. The method is particularly applicable to diagnosis of lung adenocarcinoma.

The method is particularly applicable to lung adenocarcinoma. Sequence 648 AA;

Detecting C-RAF-1 genes -

analysing prods. and clas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               W17046-W17049 are mutant versions of the mouse c-raf-1 protein, derived from four different types of tumour. They were used in a method for classifying a lymphoma or lung cancer, by comparison with the wild-type c-raf 1 protein sequence derived from different tumours in mice. The method, when used for diagnosing human tumours, involves detecting the presence of a point mutation in a conserved region of the c-raf-1 gene (codon 533, encoding Ser) derived from lymphoma or lung cancer tissue and classifying the lymphoma or lung cancer as a c-raf-1 mutation-associated cancer if one or more point mutations are present. The method is particularly applicable to diagnosis of lung adenocarcinoma.
                                                                                                                                                                                                                                                      Disclosure; Page 28; 65pp; English.

The sequence is that of a mutated version of mouse c-raf-1, the mutation occurs just downstream of the APE site, the mutation not artifactual. The region in which it occurs overlaps an epi shared by monoclonal antibodies generated against raf (Kolch e 1990). This region is a hydrophilic domain, the structure of w is predicted to be altered by this mutation.

Disclosure; Page 35; 65pp; English. The sequence is that of a mutated version of mouse c-raf-1, the mutation occurs just downstream of the APE site, the mutation is not artifactual. The region in which it occurs overlaps an epitope shared by monoclonal antibodies generated against raf (Kolch et al.
                                                                                                                                                                                                                                                                                          region

The sequence is that of human c-raf-1, the c-raf-1 gene can be used in methods for detecting and treating a wide range of cancers including lung cancer, T-cell lymphomas, renal cell carcinoma, ovarian carcinoma and mixed parotid gland tumours. The methods consist of amplifying the gene by PCR and then, based on the presence or absence of one or more mutations, individuals at increased risk can be detected and prognosis and treatment determined. The sequence is that of a mutated version of mouse c-raf-1, the mutation occurs just downstream of the APE site, the mutation is not artifactual. The region in which it occurs overlaps an epitope shared by monoclonal antibodies generated against raf (Roich et al. 1990). This region is a hydrophilic domain, the structure of which is predicted to be altered by this mutation.

CC W17046-W17049 are mutant versions of the mouse c-raf-1 protein, derived from four different types of tumour. They were used in a method for classifying a lymphoma or lung cancer, by comparison with the wild-type CC craf 1 protein sequence derived from different tumours in mice. The method, when used for diagnosing human tumours, involves detecting the CC presence of a point mutation in a conserved region of the c-raf-1 gene CC codon 533, encoding Ser) derived from lymphoma or lung cancer tissue associated cancer if one or more point mutations are present. The method is particularly applicable to diagnosis of lung adenocarcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 41.9%;

The present sequence is human Raf-1, which can be used in a novel composition comprising a complex of human Raf-1, or a fragment comprising residues 1-197 or 186-332, or lacking residues 51-131, and a 14-3-3 polypeptide (preferably human 14-3-3 beta or zeta). The composition can be used to screen for drugs which modulate the binding interaction between Raf-1 and 14-3-3, especially to identify drugs that modulate Raf-1 mediated cell cycle control, and/or neoplastic or other pathological conditions dependent on the interaction between Raf-1 and 14-3-3 beta or zeta

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Tue Jan 11 15:38:57 2000; MasPar time 1.65 Seconds 151.295 Million cell updates/sec

ar output not generated.

Description: Perfect Score: Sequence: >US-09-290-049-1 (1-21) from US09290049.pep 148 1 ANDHLSILEAWSDNDTPYLHD 21

Scoring table: PAM 150 Gap 15

Searched: 122461 seqs, 11912985 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-issued 1:5A_COMB 2:5B_COMB 3:PCT9_COMB 4:backfiles1

Statistics: Mean 19.740; Variance 68.890; scale 0.287

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
